# Computations within a functor context: Combining monads

Programs often need to combine monadic effects (see code)

- "Effect"  $\triangleq$  what else happens in  $A \Rightarrow M^B$  besides computing B from A
- Examples of effects for some standard monads:
  - Option computation will have no result or a single result
  - ▶ List computation will have zero, one, or multiple results
  - ► Either computation may fail to obtain its result, reports error
  - ▶ Reader computation needs to read an external context value
  - ▶ Writer some value will be appended to a (monoidal) accumulator
  - ► Future computation will be scheduled to run later
- How to combine several effects in the same functor block (for/yield)?

- The code will work if we "unify" all effects in a new, larger monad
- Need to compute the type of new monad that contains all given effects

## Combining monadic effects I. Trial and error

There are several ways of combining two monads into a new monad:

- If  $M_1^A$  and  $M_2^A$  are monads then  $M_1^A \times M_2^A$  is also a monad
  - lacksquare But  $M_1^A imes M_2^A$  describes two separate values with two separate effects
- ullet If  $M_1^A$  and  $M_2^A$  are monads then  $M_1^A+M_2^A$  is usually not a monad
  - lacksquare If it worked, it would be a choice between two different values / effects
- ullet If  $M_1^A$  and  $M_2^A$  are monads then one of  $M_1^{M_2^A}$  or  $M_2^{M_1^A}$  is often a monad
- Examples and counterexamples for functor composition:
  - ▶ Combine  $Z \Rightarrow A$  and List<sup>A</sup> as  $Z \Rightarrow List^A$
  - ► Combine Future [A] and Option [A] as Future [Option [A]]
  - ▶ But Either[Z, Future[A]] and Option[Z ⇒ A] are not monads
  - ▶ Neither Future[State[A]] nor State[Future[A]] are monads
- The order of effects matters when composition works both ways:
  - ▶ Combine Either  $(M_1^A = Z + A)$  and Writer  $(M_2^A = W \times A)$ 
    - \* as  $Z + W \times A$  either compute result and write a message, or all fails
    - \* as  $(Z + A) \times W$  message is always written, but computation may fail
- Find a general way of defining a new monad with combined effects
- Derive properties required for the new monad

# Combining monadic effects II. Lifting into a larger monad

If a "big monad" BigM[A] somehow combines all the needed effects:

```
// This could be valid Scala...

val result: BigM[Int] = for {
    i \leftarrow lift<sub>1</sub>(1 to n)
    j \leftarrow lift<sub>2</sub>(Future{ q(i) })
    k \leftarrow lift<sub>3</sub>(maybeError(j))

} yield f(k)

// If we define the various

// required "lifting" functions:

def lift<sub>1</sub>[A]: Seq[A] \Rightarrow BigM[A] = ???

def lift<sub>2</sub>[A]: Future[A] \Rightarrow BigM[A] = ???
```

• Example 1: combining as BigM[A] = Future[Option[A]] with liftings:

```
\begin{array}{lll} \text{def lift}_1[A]\colon \text{Option}[A] \ \Rightarrow \ \text{Future}[\text{Option}[A]] \ = \ \text{Future}.\text{successful}(\_) \\ \text{def lift}_2[A]\colon \text{Future}[A] \ \Rightarrow \ \text{Future}[\text{Option}[A]] \ = \ \_.\text{map}(x \ \Rightarrow \ \text{Some}(x)) \end{array}
```

• Example 2: combining as BigM[A] = List[Try[A]] with liftings:

```
\begin{array}{lll} def \ lift_1[A] \colon Try[A] \ \Rightarrow \ List[Try[A]] \ = \ x \ \Rightarrow \ List(x) \\ def \ lift_2[A] \colon \ List[A] \ \Rightarrow \ List[Try[A]] \ = \ \_.map(x \ \Rightarrow \ Success(x)) \end{array}
```

#### Remains to be understood:

- Finding suitable laws for the liftings; checking that the laws hold
- Building a "big monad" out of "smaller" ones, with lawful liftings
  - ▶ Is this always possible? Unique? Are there alternative solutions?
- Ways of reducing the complexity of code; make liftings automatic

## Laws for monad liftings I. Identity laws

Whatever identities we expect to hold for monadic programs must continue to hold after lifting  $M_1$  or  $M_2$  values into the "big monad" BigM

- We assume that  $M_1$ ,  $M_2$ , and BigM already satisfy all the monad laws Consider the various functor block constructions containing the liftings:
- Left identity law after lift₁
  // Anywhere inside a for/yield: // Must be equivalent to...
  i ← lift₁(M₁.pure(x)) i = x
  j ← bigM(i) // Any BigM value. j ← bigM(x)
  lift₁(M₁.pure(x)).flatMap(b) = b(x) in terms of Kleisli composition (◊):
  (pure<sub>M₁</sub>; lift₁):X⇒BigM<sup>X</sup> ⋄ b:X⇒BigM<sup>Y</sup> = b with f:X⇒M<sup>Y</sup> ⋄ g:Y⇒M<sup>Z</sup> ≜ x ⇒ f(x).flatMap(g)
  Right identity law after lift₁
  // Anywhere inside a for/yield: // Must be equivalent to...
  x ← bigM // Any BigM value. x ← bigM
  - $i \leftarrow \text{lift}_1(M_1.\text{pure}(x))$  i = x
- b.flatMap(M<sub>1</sub>.pure andThen lift<sub>1</sub>) = b in terms of Kleisli composition:  $b^{:X\Rightarrow \mathsf{BigM}^Y} \diamond (\mathsf{pure}_{\mathsf{ML},\S} \, \mathsf{lift}_1)^{:Y\Rightarrow \mathsf{BigM}^Y} = b$ 
  - The same identity laws must hold for M2 and lift2 as well

# Laws for monad liftings II. Simplifying the laws

 $(\mathsf{pure}_{M_1}, \mathsf{lift}_1)$  is a unit for the Kleisli composition  $\diamond$  in the monad  $\mathsf{BigM}$ 

- $\bullet$  But the monad  ${\tt BigM}$  already has a unit element, namely pure  ${\tt BigM}$
- $\bullet$  The two-sided unit element is always unique:  $u=u \diamond u'=u'$
- So the two identity laws for  $(pure_{M_1} ; lift_1)$  can be reduced to one law:  $pure_{M_1} ; lift_1 = pure_{BigM}$

Refactoring a portion of a monadic program under  $\mathtt{lift_1}$  gives another law:

 $\label{eq:lift1} \mbox{lift}_1(p). \mbox{flatMap}(q \mbox{ andThen lift}_1) \mbox{ = lift}_1(p \mbox{ flatMap} \mbox{ } q)$ 

- Rewritten equivalently through  $\mathrm{flm}_M:(A\Rightarrow M^B)\Rightarrow M^A\Rightarrow M^B$  as  $\mathrm{lift_1}_{\$}\,\mathrm{flm}_{\mathrm{BigM}}\,(q_{\$}\,\mathrm{lift_1})=\mathrm{flm}_{M_1}q_{\$}\,\mathrm{lift_1}$  both sides are functions  $M_1^A\Rightarrow\mathrm{BigM}^B$
- Rewritten equivalently through  $\operatorname{ftn}_M: M^{M^A} \Rightarrow M^A$ , the law is  $\operatorname{lift}_1 \operatorname{\$} \operatorname{fmap}_{\operatorname{BigM}} \operatorname{lift}_1 \operatorname{\$} \operatorname{ftn}_{\operatorname{BigM}} = \operatorname{ftn}_{M_1} \operatorname{\$} \operatorname{lift}_1 \operatorname{both} \operatorname{sides} \operatorname{are functions} M_1^{M_1^A} \Rightarrow \operatorname{BigM}^A$
- In terms of Kleisli composition  $\diamond_M$  it becomes the **composition law**:  $(b^{:X\Rightarrow M_1^Y}, \text{lift}_1) \diamond_{\mathsf{BigM}} (c^{:Y\Rightarrow M_1^Z}, \text{lift}_1) = (b \diamond_{M_1} c), \text{lift}_1$
- Liftings lift
   ind lift
   must obey an identity law and a composition law
  - ▶ The laws say that the liftings **commute with** the monads' operations

## Laws for monad liftings III. The naturality law

Show that lift<sub>1</sub>:  $M_1^A \Rightarrow BigM^A$  is a natural transformation

- It maps  $pure_{M_1}$  to  $pure_{BigM}$  and  $flm_{M_1}$  to  $flm_{BigM}$ 
  - ▶ lift<sub>1</sub> is a **monadic morphism** between monads  $M_1^{\bullet}$  and BigM $^{\bullet}$
- ightharpoonup example: monad "interpreters"  $M^A \Rightarrow N^A$  are monadic morphisms

The (functor) naturality law: for any  $f: X \Rightarrow Y$ ,

$$\begin{split} \mathsf{lift_{1}}^\circ_{\mathfrak{f}} \mathsf{fmap}_{\mathsf{BigM}} f &= \mathsf{fmap}_{M_1} f^\circ_{\mathfrak{f}} \mathsf{lift_{1}} \\ M_1^X & \xrightarrow{\mathsf{lift_{1}}} \to \mathsf{BigM}^X \\ \mathsf{fmap}_{M_1} f^{:X \Rightarrow Y} \middle\downarrow & \bigvee_{\mathsf{fmap}_{\mathsf{BigM}}} f^{:X \Rightarrow Y} \\ M_1^Y & \xrightarrow{\mathsf{lift_{1}}} \to \mathsf{BigM}^Y \end{split}$$

Derivation of the functor naturality law for lift<sub>1</sub>:

- Express fmap as fmap<sub>M</sub> $f \triangleq f^{\uparrow M} = \text{flm}_M(f; \text{pure}_M)$  for both monads
- Given  $f: X \Rightarrow Y$ , use the law  $\operatorname{flm}_{M_1} q_{\sharp} \operatorname{lift}_1 = \operatorname{lift}_{1\sharp} \operatorname{flm}_{\operatorname{BigM}} (q_{\sharp} \operatorname{lift}_1)$  to compute  $\operatorname{flm}_{M_1} (f_{\sharp} \operatorname{pure}_{M_1})_{\sharp} \operatorname{lift}_1 = \operatorname{lift}_{1\sharp} \operatorname{flm}_{\operatorname{BigM}} (f_{\sharp} \operatorname{pure}_{M_1}^* \operatorname{lift}_1) = \operatorname{lift}_{1\sharp} \operatorname{flm}_{\operatorname{BigM}} (f_{\sharp} \operatorname{pure}_{\operatorname{BigM}}) = \operatorname{lift}_{1\sharp} \operatorname{flm}_{\operatorname{BigM}} f$

A monadic morphism is always also a natural transformation of the functors

#### Monad transformers I: Motivation

- Combine  $Z \Rightarrow A$  and 1 + A: only  $Z \Rightarrow 1 + A$  works, not  $1 + (Z \Rightarrow A)$ 
  - ▶ It is not possible to combine monads via a natural bifunctor  $B^{M_1,M_2}$
  - It is not possible to combine arbitrary monads as  $M_1^{M_2^{\bullet}}$  or  $M_2^{M_1^{\bullet}}$ 
    - **\*** Example: state monad  $St_S^A \triangleq S \Rightarrow A \times S$  does not compose
- The trick: for a fixed base monad  $L^{\bullet}$ , let  $M^{\bullet}$  (foreign monad) vary
- Call the desired result  $T_L^{M,\bullet}$  the monad transformer for L
  - ► In Scala: MyMonadT[M[\_]:Monad, A] e.g. ReaderT, StateT, etc.
- $T_L^{M,\bullet}$  is generic in M but not in L
  - ▶ No general formula for monad transformers seems to exist
  - ▶ For each base monad L, a different construction is needed
    - \* Some transformers are compositions  $L^{M^{\bullet}}$  or  $M^{L^{\bullet}}$ , others are not
  - ▶ Do all monads L have a transformer? (Unknown.)
- To combine 3 or more monads, "stack up" the transformers as  $T_{L_2}^{T_{L_3}^M}$ ,• Example in Scalar Statement as  $T_{L_2}^{T_{L_3}}$ .
  - ► Example in Scala: StateT[S, ListT[Reader[R, ?], ?], A]
  - Substitute nested transformers into the monad argument, not as A
- This is called a monad stack but may not be functor composition
  - because e.g. State[S, List[Reader[R, A]]] is not a monad

## Monad transformers II: The requirements

A monad transformer for a base monad  $L^{\bullet}$  is a type constructor  $T_L^{M, \bullet}$  parameterized by a monad  $M^{\bullet}$ , such that for all monads  $M^{\bullet}$ :

- $T_L^{M,\bullet}$  is a monad (the monad M transformed with  $T_L$ )
- "Lifting" a monadic morphism lift $_L^M: M^A \leadsto T_L^{M,A}$
- "Base lifting" a monadic morphism blift : L<sup>A</sup> → T<sub>L</sub><sup>M,A</sup>
   The "base lifting" could not possibly be natural in L<sup>•</sup>
- ullet Transformed identity monad (Id) must become L, i.e.  $\mathcal{T}_L^{\operatorname{Id},ullet}\cong L^ullet$
- $T_L^{M,\bullet}$  is monadically natural in  $M^{\bullet}$  (but not in  $L^{\bullet}$ )
  - $T_L^{M,\bullet}$  is natural w.r.t. a monadic functor  $M^{\bullet}$  as a type parameter
  - For any monad  $N^{\bullet}$  and a monadic morphism  $f: M^{\bullet} \leadsto N^{\bullet}$  we need to have a monadic morphism  $T_L^{M, \bullet} \leadsto T_L^{N, \bullet}$  for the transformed monads:  $\operatorname{mrun}_L^M: (M^{\bullet} \leadsto N^{\bullet}) \Rightarrow T_L^{M, \bullet} \leadsto T_L^{N, \bullet}$  with the "lifting" laws
    - ★ If we implement  $T_L^{M,\bullet}$  only via M's monad methods, naturality will hold
  - ► Cf. traverse:  $L^A \Rightarrow (A \Rightarrow F^B) \Rightarrow F^{L^B}$  natural w.r.t. applicative  $F^{\bullet}$  ► This can be used for lifting a "runner"  $M^A \rightsquigarrow A$  to  $T_I^{M, \bullet} \rightsquigarrow T_I^{\text{Id}, \bullet} = L^{\bullet}$
- "Base runner": lifts  $L^A \sim A$  into a monadic morphism  $T_L^{M,\bullet} \sim M^{\bullet}$ ; so

 $\operatorname{brun}_{L}^{M}: (L^{\bullet} \leadsto \bullet) \Rightarrow T_{L}^{M, \bullet} \leadsto M^{\bullet}, \text{ must commute with lift and blift}$ Sergei Winitzki (ABTB)

Chapter 11: Monad transformers

2019-01-05

9 / 2

# Monad transformers III: First examples

Recall these monad constructions:

- If  $M^A$  is a monad then  $R \Rightarrow M^A$  is also a monad (for a fixed type R)
- If  $M^A$  is a monad then  $M^{Z+A\times W}$  is also a monad (for fixed W, Z)

This gives the monad transformers for base monads Reader, Writer, Either:

```
type ReaderT[R, M[_], A] = R \Rightarrow M[A] type EitherT[Z, M[_], A] = M[Either[Z, A]] type WriterT[W, M[_], A] = M[(W, A)]
```

- ReaderT composes with the foreign monad from the *outside*
- EitherT and WriterT must be composed *inside* the foreign monad Remaining questions:
  - What are transformers for other standard monads (List, State, Cont)?
    - ► These monads do not compose (neither "inside" nor "outside" works)!
  - How to derive a monad transformer for an arbitrary given monad?
    - For monads obtained via known monad constructions?
    - ► For monads constructed via other monad transformers? (Stack them.)
    - Is it always possible? (No known counterexamples.)
  - Is a given monad's transformer unique? (No.)
  - How to avoid the boilerplate around lift? (mtl-style transformers)

# Monad transformers IV: The zoology of ad hoc methods

Need to choose the correct monad transformer construction, per monad:

- "Composed-inside", base monad is inside foreign monad:  $T_L^{M,A} = M^{L^A}$ 
  - ► Examples: the **linear** monads OptionT, WriterT, EitherT
- "Composed-outside" the base monad is outside:  $T_L^{M,A} = L^{M^A}$ 
  - ▶ Examples: ReaderT; SearchT for search monad  $S[A] = (A \Rightarrow Z) \Rightarrow A$
  - ▶ More generally: all **rigid** monads have "outside" transformers
- "Recursive": interleaves the base monad and the foreign monad
  - Examples: ListT, NonEmptyListT, FreeMonadT
- Monad constructions: defining a transformer for new monads
  - ▶ Product monads  $L_1^A \times L_2^A$  product transformer  $T_{L_1}^{M,A} \times T_{L_2}^{M,A}$
  - "Contrafunctor-choice"  $H^A \Rightarrow A$  composed-outside transformer
  - Free pointed monads  $A + L^A$  transformer  $M^{A+T_L^{M,A}}$
- "Irregular": none of the above constructions work, need something else
  - ►  $T_{\mathsf{State}}^{M,A} = S \Rightarrow M^{S \times A}$ ;  $T_{\mathsf{Cont}}^{M,A} = (A \Rightarrow M^R) \Rightarrow M^R$ ; "selector"  $F^{A \Rightarrow P^Q} \Rightarrow P^A$ - transformer  $F^{A \Rightarrow T_P^{M,Q}} \Rightarrow T_P^{M,A}$ ; codensity  $\forall R. (A \Rightarrow M^R) \Rightarrow M^R$
- ullet Examples of monads  $K^A$  for which no transformers exist? (not known)
  - $ightharpoonup T_{Cod}$ ,  $T_{Sel}$ , and  $T_{Cont}$  transformers have no blift, brun, or mrun

# Composed-inside transformers I

Base monad  $L^{\bullet}$ , foreign monad  $M^{\bullet}$ , transformer  $T_{I}^{M,\bullet} \triangleq T^{\bullet} \triangleq M^{L^{\bullet}}$ 

- Monad instance: use the natural transformation  $sw^A: L^{M^A} \Rightarrow M^{L^A}$  pure<sub>T</sub>:  $A \Rightarrow M^{L^A}$  is defined as  $pure_T = pure_M$ ;  $pure_T^{M}$ 

  - $\operatorname{ftn}_T: T^{T^A} \Rightarrow T^A$  is defined as  $\operatorname{ftn}_T = \operatorname{sw}^{\uparrow M}_{\downarrow} \operatorname{ftn}_{\downarrow}^{\uparrow M \uparrow M} \operatorname{ftn}_{M}$

$$T^{T^{A}} \triangleq M^{L^{M^{L^{A}}}} \xrightarrow[\mathsf{fmap}_{M}(\mathsf{sw}^{L^{A}})]{} \rightarrow M^{M^{L^{A}}} \xrightarrow[\mathsf{fmap}_{M}(\mathsf{fmap}_{M}\mathsf{ftn}_{L})]{} M^{M^{L^{A}}} \xrightarrow[\mathsf{ftn}_{M}]{} \rightarrow M^{L^{A}} \triangleq T^{A}$$

- Monad laws must hold for T<sup>A</sup> (must check this separately)
  - ▶ This depends on special properties of sw, e.g. pure  $\int_{1}^{\infty} sw = pure \int_{1}^{\infty} ds$ (*L*-identity);  $pure_{M}^{\uparrow L}$ ;  $sw = pure_{M}$  (*M*-identity) and other laws
    - ★ See example code that verifies these laws for  $L^A \triangleq E + W \times A$
    - ★ It is not enough to have any traversable functor L• here!
- Monad transformer methods for  $T_{\iota}^{M,\bullet} \triangleq M^{L^{\bullet}}$ :
  - Lifting, lift :  $M^A \Rightarrow M^{L^A}$  is equal to pure  $M^{\uparrow M}$
  - ▶ Base lifting, blift :  $L^A \Rightarrow M^{L^A}$  is equal to pure<sub>M</sub>
  - ▶ Runner, mrun :  $(\forall B.M^B \Rightarrow N^B) \Rightarrow M^{L^A} \Rightarrow N^{L^A}$  is equal to id
  - ▶ Base runner, brun :  $(\forall B.L^B \Rightarrow B) \Rightarrow M^{L^A} \Rightarrow M^A$  is equal to fmap<sub>M</sub>

# \* Composed-inside transformers II. Proofs of lifting laws

Base monad  $L^{\bullet}$ , foreign monad  $M^{\bullet}$ , transformer  $T_L^{M, \bullet} \triangleq T^{\bullet} \triangleq M^{L^{\bullet}}$ 

- Identity laws for the monad  $T^{\bullet}$  hold if they hold for  $L^{\bullet}$  and  $M^{\bullet}$  and if the properties  $\operatorname{pure}_{L}^{\uparrow M}$  sw =  $\operatorname{pure}_{M}^{\uparrow L}$  sw =  $\operatorname{pure}_{M}^{L}$  hold
- $\operatorname{pure}_{\mathcal{T}}$  \$\( \text{ftn}\_{\mathcal{T}} = \operatorname{id. Proof: } \left( \operatorname{pure}\_{M} \) \( \operatorname{pure}\_{L} \) \( \operatorname{sw}^{\tau\_{M}} \) \( \operatorname{ftn}\_{L}^{\tam{M} \tau\_{M}} \) \( \operatorname{ftn}\_{L}^{\tau{M} \tau\_{M}} \) \( \operatorname{ftn}\_{L}^{\tau\_{M} \tau\_{M}} \) \( \operatorname{ftn}\_{L}^
- pure  $_T^{\uparrow T}$ ; ftn  $_T$  = id. Proof: pure  $_T$  = pure  $_M$ ; pure  $_L^{\uparrow M}$  = pure  $_L$ ; pure  $_M$  (naturality); for all f:  $f^{\uparrow T} = f^{\uparrow L \uparrow M}$  and f; pure  $_M$  = pure  $_M$ ;  $f^{\uparrow M}$  (naturality); so pure  $_T^{\uparrow T}$ ; ftn  $_T$  is (pure  $_L$ ; pure  $_M$ )  $_T^{\uparrow L \uparrow M}$ ; (sw  $_L^{\uparrow M}$ ; ftn  $_L^{\uparrow M \uparrow M}$ ; ftn  $_M$ ) = pure  $_L^{\uparrow L \uparrow M}$ ; pure  $_M^{\uparrow M}$ ; ftn  $_L^{\uparrow M \uparrow M}$ ; ftn  $_M$  = id where we used naturality with  $_T$  = pure  $_L^{\uparrow L}$
- lift's identity law:  $pure_{M^{\S}}$  lift =  $pure_{T}$  (this is the definition of  $pure_{T}$ )
- Composition law: lift; lift<sup>↑</sup> ; ftn<sub>T</sub> = ftn<sub>M</sub>; lift. Proof: ftn<sub>M</sub>; pure<sub>L</sub><sup>↑M</sup> = pure<sub>L</sub><sup>↑M↑M</sup>; ftn<sub>M</sub> and pure<sub>L</sub><sup>↑M</sup>; (pure<sub>L</sub><sup>↑M↑L↑M</sup>; sw<sup>↑M</sup>); ftn<sub>L</sub><sup>↑M↑M</sup>; ftn<sub>M</sub> = (pure<sub>L</sub><sup>↑M</sup>; sw<sup>↑M</sup>); (pure<sub>L</sub><sup>↑L↑M↑M</sup>; ftn<sub>L</sub><sup>↑M↑M</sup>); ftn<sub>M</sub> = pure<sub>L</sub><sup>↑M↑M</sup>; ftn<sub>M</sub>
- blift's identity law:  $pure_{L^{\S}}blift = pure_{T}$ . ( $pure_{L^{\S}}pure_{M} = pure_{M^{\S}}pure_{L}^{\uparrow M}$ )
- Composition law: blift; blift<sup>†</sup> ; ftn<sub>T</sub> = ftn<sub>L</sub>; blift. Proof: pure<sub>M</sub>; pure<sub>M</sub><sup>†</sup>; (sw<sup>†M</sup>; ftn<sub>L</sub><sup>†</sup>, ftn<sub>M</sub>) = pure<sub>M</sub>; (pure<sub>M</sub><sup>†M</sup>; ftn<sub>L</sub><sup>†</sup>, ftn<sub>M</sub>); ftn<sub>M</sub> = pure<sub>M</sub>; (ftn<sub>L</sub><sup>†M</sup>; pure<sub>M</sub>); ftn<sub>M</sub> = ftn<sub>L</sub>; pure<sub>M</sub>; (pure<sub>M</sub>); ftn<sub>M</sub>) = ftn<sub>L</sub>; blift

#### \* Composed-inside transformers III. Proofs of runner laws

- Given a monadic morphism  $\phi: M^{\bullet} \leadsto N^{\bullet}$ , we need to show that mrun  $\phi \triangleq \phi: M^{L^{\bullet}} \leadsto N^{L^{\bullet}}$  is also a monadic morphism
- $\phi$ 's laws are  $pure_M$ ;  $\phi = pure_N$  and  $ftn_M$ ;  $\phi = \phi^{\uparrow M}$ ;  $\phi$ ;  $ftn_N$  and  $f^{\uparrow M}$ ;  $\phi = \phi$ ;  $f^{\uparrow N}$
- $\bullet \ \, \mathsf{Identity} \ \, \mathsf{law} \colon \, \mathsf{pure}_{L^{\,\S}} \, \mathsf{pure}_{M^{\,\S}} \, \phi = \mathsf{pure}_{L^{\,\S}} \, \mathsf{pure}_{N} \, \, \mathsf{follows} \, \, \mathsf{from} \, \, \phi \, \mathsf{'s} \, \, \mathsf{law}$
- Given a monadic morphism  $\phi: L^A \leadsto A$ , we need to show that brun  $\phi \triangleq \phi^{\uparrow M}: M^{L^A} \Rightarrow M^A$  is also a monadic morphism
- $\phi$ 's laws are  $\operatorname{pure}_{L^{\S}}\phi=\operatorname{id}$  and  $\operatorname{ftn}_{L^{\S}}\phi=\phi_{\S}\phi$  and  $f^{\uparrow L}_{\S}\phi=\phi_{\S}f$ ; also  $\operatorname{sw}_{\S}\phi^{\uparrow M}=\phi$
- Identity law:  $\mathsf{pure}_{\mathcal{T}}, \phi^{\uparrow M} = \mathsf{pure}_{\mathcal{L}}, (\mathsf{pure}_{\mathcal{M}}, \phi^{\uparrow M}) = (\mathsf{pure}_{\mathcal{L}}, \phi), \mathsf{pure}_{\mathcal{M}} = \mathsf{pure}_{\mathcal{M}}$
- Composition law:  $\operatorname{ftn}_{M^L} \circ \phi^{\uparrow M} = \phi^{\uparrow M} \circ \phi^{\uparrow M \uparrow M} \circ \operatorname{ftn}_{M} \operatorname{as functions} T^{\tau \bullet} \Rightarrow M^{\bullet}$ . Proof:  $\operatorname{sw}^{\uparrow M} \circ (\operatorname{ftn}_{L}^{\uparrow M \uparrow M} \circ \operatorname{ftn}_{M}) \circ \phi^{\uparrow M} = \operatorname{sw}^{\uparrow M} \circ (\operatorname{ftn}_{L} \circ \phi)^{\uparrow M} = \operatorname{sw}^{\uparrow M} \circ (\operatorname{ftn}_{M} \circ \phi^{\uparrow M}) \circ (\operatorname{ftn}_{M} \circ \phi^{\dag M}) \circ (\operatorname{ftn}_$

## Rigid monads I: Definitions

- A **rigid monad**  $R^{\bullet}$  has a composed-outside transformer,  $T_R^{M,A} \triangleq R^{M^A}$ 
  - ► Examples:  $R^A \triangleq A \times A$  and  $R^A \triangleq Z \Rightarrow A$  are rigid;  $R^A \triangleq 1 + A$  is not
  - ▶ For any monad M, we then have sw :  $M^{R^A} \Rightarrow R^{M^A}$  defined by

$$\mathsf{sw} = \mathsf{pure}_{M}^{\uparrow R \uparrow M} \, \, \, \, \, \, \mathsf{pure}_{R} \, \, \, \, \, \, \, \mathsf{ftn}_{T}$$

$$M^{R^{A}}_{\text{fmap, (fmap, (pure, ))}} \to M^{R^{M^{A}}}_{\text{pure}_{R}} \to R^{M^{R^{M^{A}}}} = T^{T^{A}} \xrightarrow{\text{ftn}_{T}} \to T^{A} \triangleq R^{M^{A}}$$

• Is ftn<sub>T</sub> definable via sw with some additional laws? (Yes.)

#### Examples and constructions of rigid monads:

- Rigid: Id, Reader, and  $R^A \triangleq H^A \Rightarrow A$  (where H is a contrafunctor)
  - ▶ The construction  $R^A \triangleq H^A \Rightarrow A$  covers  $R^A \triangleq 1$ ,  $R^A \triangleq A$ ,  $R^A \triangleq Z \Rightarrow A$
- The selector monad  $S^A \triangleq F^{A \Rightarrow R^Q} \Rightarrow R^A$  is rigid if  $R^{\bullet}$  is rigid
  - ▶ Simple example: search with failure,  $S^A \triangleq (A \Rightarrow Bool) \Rightarrow 1 + A$
- ullet The composition of rigid monads,  $R_1^{R_2^A}$ , is a rigid monad
- The product of rigid monads,  $R_1^A \times R_2^A$ , is a rigid monad

## Rigid functors, their laws and structure I

- A rigid functor  $R^{\bullet}$  has the method fuseIn:  $(A \Rightarrow R^B) \Rightarrow R^{A \Rightarrow B}$ 
  - ▶ Rigid monads are rigid functors since fi = sw with  $M^A \triangleq Z \Rightarrow A$
  - ► Compare with fuseOut:  $R^{A\Rightarrow B} \Rightarrow A \Rightarrow R^B$ , which exists for any functor
    - **★** Implementation: **fo**  $h^{:R^{A\Rightarrow B}} = x^{:A} \Rightarrow (f^{:A\Rightarrow B} \Rightarrow fx)^{\uparrow R} h$
- Nondegeneracy law: fuseOut(fuseIn(x)) == x or fi; fo = id
- fi must be natural in both type parameters
  - Naturality: fi  $(f_{\$}g^{\uparrow R}) = (q^{:A\Rightarrow B} \Rightarrow q_{\$}g)^{\uparrow R}$  (fi f) for  $\forall f^{:A\Rightarrow R^B}$ ,  $g^{:B\Rightarrow C}$  and fi  $(f_{\$}g) = (q^{:B\Rightarrow C} \Rightarrow f_{\$}q)^{\uparrow R}$  (fi g) for  $\forall f^{:A\Rightarrow B}$ ,  $g^{:B\Rightarrow R^C}$
- Connection between monadic flatMap and applicative ap for monadic R:
  - flm :  $(A \Rightarrow R^B) \Rightarrow R^A \Rightarrow R^B$
  - ightharpoonup ap :  $R^{A \Rightarrow B} \Rightarrow R^{A} \Rightarrow R^{B}$
  - ▶ The connection is flm = fi; ap and ap = fo; flm
    - ★ However, here we need to flip the order of *R*-effects in ap
  - ▶ Connection between ap and fo is fo x a = ap x (pure a)
- If flm = fi; ap then fi; fo = id. Proof: set  $x^{:R^{A \to B}} = \text{fi } h^{:A \to R^B}$  and get fo x = ap (fi h) (pure a) = flm h (pure a) = h = a, so fo (fi h) = h
- Conversely: If fiş fo = id and ap = foş flm then flm = fiş ap.

  Proof: fis ap = fis fos flm = flm

# Rigid functors, their laws and structure II

#### Examples and constructions of rigid functors (see code):

- $R^A \triangleq H^A \Rightarrow Q^A$  is a rigid functor (not monad) if  $Q^A$  is a rigid functor • Not rigid:  $R^A \triangleq W \times A$ .  $R^A \triangleq E + A$ . List<sup>A</sup>. Cont<sup>A</sup>. State<sup>A</sup>
- Products and compositions of rigid functors are rigid

#### Use cases for rigid functors:

- A rigid functor is pointed: a natural transformation  $A \Rightarrow R^A$  exists
- ullet A rigid functor has a *single constructor* because  $R^1\cong 1$
- Can handle multiple  $M^{\bullet}$  effects at once: For a rigid functor  $R^{\bullet}$  and any monad  $M^{\bullet}$ , have "R-valued M-flatMap":  $M^{A} \times (A \Rightarrow R^{M^{B}}) \Rightarrow R^{M^{B}}$
- Uptake monadic API: For a rigid functor  $R^{\bullet}$ , can implement a general refactoring function, refactor:  $((A \Rightarrow B) \Rightarrow C) \Rightarrow (A \Rightarrow R^B) \Rightarrow R^C$ , to transform a program  $p(f^{A\Rightarrow B}) : C$  into  $\tilde{p}(\tilde{f}^{:A\Rightarrow R^B}) : R^C$

# Rigid monads II: Composed-outside transformers

Base rigid monad  $R^{\bullet}$ , foreign monad  $M^{\bullet}$ , transformer  $T_R^{M, \bullet} \triangleq T^{\bullet} \triangleq R^{M^{\bullet}}$ 

- Monad instance: define the Kleisli category with morphisms  $A \Rightarrow R^{M^A}$
- pure  $_T: A \Rightarrow R^{M^A}$  is defined by  $pure_T \triangleq pure_{M^{\$}} pure_R = pure_{R^{\$}} pure_M^{\uparrow R}$
- $\operatorname{ftn}_T: T^{T^A} \Rightarrow T^A$  must be defined case by case for each construction
  - ▶ If  $R^{M^{\bullet}}$  is a monad then we can define sw :  $M^{R^{\bullet}} \sim R^{M^{\bullet}}$
  - ▶ Choosing  $M^A \triangleq Z \Rightarrow A$ , we get sw = fi :  $(Z \Rightarrow R^A) \Rightarrow R^{Z \Rightarrow A}$ 
    - ★ Open question: Is a rigid monad always a rigid functor?

Define rigid monads via the existence of composed-outside transformers

- Monad transformer methods for  $T_R^{M,\bullet} \triangleq R^{M^{\bullet}}$ :
  - ▶ Lifting, lift :  $M^A \Rightarrow R^{M^A}$  is equal to pure<sub>M</sub>
  - ▶ Base lifting, blift :  $R^A \Rightarrow R^{M^A}$  is equal to pure $M_A$
  - ▶ Runner, mrun :  $(\forall B.M^B \Rightarrow N^B) \Rightarrow R^{M^A} \Rightarrow R^{N^A}$  is equal to fmap<sub>R</sub>
  - ▶ Base runner, brun :  $(\forall B.R^B \Rightarrow B) \Rightarrow R^{M^A} \Rightarrow M^A$  is equal to id
- Checking the monad transformer laws, case by case
  - ▶ The laws hold for  $R^A \triangleq H^A \Rightarrow A$  and  $R^A \triangleq F^{A \Rightarrow P^Q} \Rightarrow P^A$
  - ▶ The laws hold for composition and product of rigid monads
    - ★ Any other constructions or examples? (Not known.)

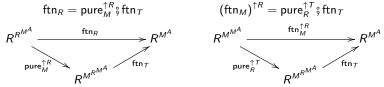

# \* Rigid monads III: Some tricks for proving the laws

- Some monads involve a higher-order function, e.g.:
  - $P^A \triangleq H^A \Rightarrow A, \ R^A \triangleq \left(A \Rightarrow P^Q\right) \Rightarrow P^A, \ R^A \triangleq \forall B. \left(A \Rightarrow F^B\right) \Rightarrow F^B$
- Proving laws for these monads is easier with these tricks:
  - **1** Instead of defining flm<sub>R</sub> or ftn<sub>R</sub> directly, use the Kleisli functions and  $\Diamond_R$   $f^{:A\Rightarrow R^B} \Diamond_R g^{:B\Rightarrow R^C} : A \Rightarrow R^C$
  - ② Flip the arguments of the Kleisli functions: for example, instead of  $A \Rightarrow R^B \triangleq A \Rightarrow (B \Rightarrow P^Q) \Rightarrow P^B$ , work with  $(B \Rightarrow P^Q) \Rightarrow A \Rightarrow P^B$
  - 3 Use the Kleisli product for the nested monad: for example, to define

$$f^{:(B\Rightarrow P^Q)\Rightarrow A\Rightarrow P^B} \diamond_R g^{:(C\Rightarrow P^Q)\Rightarrow B\Rightarrow P^C}: (C\Rightarrow P^Q)\Rightarrow A\Rightarrow P^C$$

use the Kleisli product  $\diamond_P$  as  $m^{:A\Rightarrow P^B} \diamond_P n^{:B\Rightarrow P^C}: A\Rightarrow P^C$  to obtain  $B\Rightarrow P^Q$  from  $B\Rightarrow P^C$  and  $C\Rightarrow P^Q$ , and then to get  $A\Rightarrow P^C$ 

• Use "compatibility laws": for any monad M, and denoting  $T^{\bullet} \triangleq R^{M^{\bullet}}$ 

# Rigid monads IV: Open questions

- What properties of fi :  $(A \Rightarrow R^B) \Rightarrow R^{A \Rightarrow B}$  define rigid monads?
  - ► The law fi; fo = id does not appear to be sufficient
  - Not clear if fig fo = id follows from monadicity of  $R^{M^{\bullet}}$
- A (generalized) functor from Kleisli category to "applicative" category?
  - ▶ Identity law: fi (pure<sub>R</sub>) = pure<sub>R</sub> (id) this holds
  - ► Composition law:  $fi(f \diamond_R g) = (p \times q \Rightarrow p_{\$}q)^{\uparrow R} (fif \bowtie fig)$

★ not clear whether this holds in general

Define the rigid monad transformer using fi?

• Define  $\diamond_T$  by  $f \diamond_T g \triangleq \text{fo}((p \times q \Rightarrow p \diamond_M q)^{\uparrow R}(\text{fi } f \bowtie_R \text{fi } g))$ 

- not clear whether this holds
  - ★ not clear whether associativity can be shown to hold in general

# Attempts to create a general monad transformer

General recipes for combining two functors  $L^{\bullet}$  and  $M^{\bullet}$  all fail:

- "Fake" transformers:  $T_L^{M,A} \triangleq L^A$ ; or  $T_L^{M,A} \triangleq M^A$ ; or just  $T_L^{M,A} \triangleq 1$ 
  - ▶ no lift and/or no base runner and/or  $T_L^{Id,A} \not\cong L^A$
- Functor composition, disjunction, or product:  $L^{M^{\bullet}}$ ,  $M^{L^{\bullet}}$ ,  $L^{\bullet} + M^{\bullet} -$  not a monad in general;  $L^{\bullet} \times M^{\bullet} -$  no lift:  $M^{\bullet} \leadsto L^{\bullet} \times M^{\bullet}$
- Making a monad out of functor composition or disjunction:
  - free monad over  $L^{M^{\bullet}}$ , Free  $L^{M^{\bullet}}$  lift violates lifting laws
  - free monad over  $L^{ullet}+M^{ullet}$ , Free  $L^{ullet+M^{ullet}}-{\tt lift}$  violates lifting laws
    - \* Laws will hold after interpreting the free monad into a concrete monad code sity monad ever  $I_{M^{\bullet}}^{M^{\bullet}}$ ;  $E^{A} \triangleq \forall B$   $(A \rightarrow I_{M^{B}}^{M^{B}}) \rightarrow I_{M^{B}}^{M^{B}}$  no life.
  - ▶ codensity monad over  $L^{M^{\bullet}}$ :  $F^{A} \triangleq \forall B. (A \Rightarrow L^{M^{B}}) \Rightarrow L^{M^{B}}$  no lift
- Codensity-L transformer:  $Cod_L^{M,A} \triangleq \forall B. (A \Rightarrow L^B) \Rightarrow L^{M^B} \text{no lift}$ 
  - ▶ applies the continuation transformer to  $M^A \cong \forall B. (A \Rightarrow B) \Rightarrow M^B$
- Codensity composition:  $F^A \triangleq \forall B. (M^A \Rightarrow L^B) \Rightarrow L^B \text{not a monad}$ 
  - ▶ Counterexample:  $M^A \triangleq R \Rightarrow A$  and  $L^A \triangleq S \Rightarrow A$
- "Monoidal" convolution:  $(L \star M)^A \triangleq \exists P \exists Q. (P \times Q \Rightarrow A) \times L^P \times M^Q$ 
  - ▶ combines  $L^A \cong \exists P.L^P \times (P \Rightarrow A)$  with  $M^A \cong \exists Q.M^Q \times (Q \Rightarrow A)$
  - ▶  $L \star M$  is not a monad for e.g.  $L^A \triangleq 1 + A$  and  $M^A \triangleq R \Rightarrow A$

#### Exercises

- **②** Show that the method pure:  $A \Rightarrow M^A$  is a monadic morphism between monads  $\operatorname{Id}^A \triangleq A$  and  $M^A$ . Show that  $1 \Rightarrow 1 + A$  is not a monadic morphism.
- ② Show that  $M_1^A + M_2^A$  is *not* a monad when  $M_1^A \triangleq 1 + A$  and  $M_2^A \triangleq Z \Rightarrow A$ .
- **3** Derive the composition law for lift written using ftn as  $lift_1$ ;  $fmap_{BigM} lift_1$ ;  $ftn_{BigM} = ftn_{M_1}$ ;  $lift_1$  from the flm-based law  $lift_1$ ;  $flm_{BigM} (q$ ;  $lift_1) = flm_{M_1} q$ ;  $lift_1$ . Draw type diagrams for both laws.
- Show that the continuation monad is not rigid and does not compose with arbitrary other monads. Show that the list and state monads are not rigid.
- Show that fo  $(pure_P(f^{:A\Rightarrow B})) = f_{\S} pure_P$  for any pointed functor P.
- A rigid monad has a pure method because it is a monad, and also another pure method because it is a rigid functor. Show that these two pure methods must be the same.
- **3** Show that  $T_{L_1}^{M,A} \times T_{L_2}^{M,A}$  is the transformer for the monad  $L_1 \times L_2$ .
